## Animation of Skeletons with Hinges and Spherical Joints

A derivation by Jan Hakenberg dedicated to Nikolai Sperling.

Abstract: We derive an algorithm to animate a skeleton of rigid bodies that are linked by hinges and spherical joints. Over the course of the simulation, the total linear momentum, and the total angular momentum are invariant. If desired, the algorithm incorporates intrinsic torques of the joints such as friction, and motor control. Otherwise, the total kinetic energy is invariant, too.

## - Types of joints

We intend to animate skeletons of rigid bodies that are linked by any combination of hinges and spherical joints. A hinge has a distinct axis of rotation, around which the attached bodies rotate relative to each other. Therefore, we visualize a hinge by a cylinder. The levers of a spherical joint are free to revolve around any axis relative to each other. We represent a spherical joint by a sphere.

Our article starts by considering skeletons with hinges only. However, the introduction of spherical joints turns out to be simple at a later point: the vector that formerly represented the axis of a hinge is just set to zero.

## - Topology of the skeleton

The skeleton shall consist of $n+1$ rigid bodies that are pairwise linked by $n$ hinges. (Later, any hinge can be replaced by a spherical joint.) The topology of the skeleton resembles a tree, i.e. a connected graph with no circles. We enumerate the bodies with the index $i=1,2, \ldots, n+1$, and we enumerate the hinges using $j=1,2, \ldots, n$. The connectivity of the skeleton is encoded in the ( $n, 2$ )-matrix $E$, where row $j$ of $E$ contains the indices of the two bodies connected by hinge $j$. From $E$ we construct the ( $n, n+1$ )-matrix $\sigma$ with entries as

$$
\sigma_{j, i}=\left\{\begin{array}{cl}
+1 & \text { for } i=E(j, 1) \\
-1 & \text { for } i=E(j, 2) \\
0 & \text { otherwise }
\end{array}\right.
$$

Example: The skeleton depicted above serves as an example throughout the document. The skeleton consists of 3 bodies and $n=2$ hinges. Using the indexing as in the graphics, the topology is encoded by

$$
E=\left(\begin{array}{ll}
1 & 2 \\
2 & 3
\end{array}\right) \quad \text { and } \quad \sigma=\left(\begin{array}{ccc}
1 & -1 & 0 \\
0 & 1 & -1
\end{array}\right)
$$

## - Generic equations of motion

The state of the body $i=1,2, \ldots, n+1$ is defined by the following variables:

| $p_{i}$ | center of mass in world coordinates $\bullet(3)$-vector |
| :--- | :--- |
| $R_{i}$ | orientation transforming from object to world coordinates $\bullet$ orthogonal (3,3)-matrix |
| $v_{i}$ | linear velocity in world coordinates $\bullet(3)$-vector |
| $\omega_{i}$ | angular velocity in object coordinates •(3)-vector |
| $I_{i}$ | inertia tensor $\bullet$ constant symmetric (3,3)-matrix |
| $m_{i}$ | mass $\bullet$ constant real value, greater than zero |

The dynamics of each body $i$ are determined by
$a_{i} \quad$ linear acceleration in world coordinates $\bullet$ (3)-vector
$\tau_{i} \quad$ torque in object coordinates $\cdot$ (3)-vector
The entities $p_{i}, R_{i}, v_{i}, \omega_{i}, a_{i}, \tau_{i}$ depend on time $t$, while the inertia and mass $I_{i}, m_{i}$ are assumed to be constant. The linear motion results from the differential equations

$$
\begin{aligned}
& \mathrm{d}_{t} v_{i}=a_{i} \\
& \mathrm{~d}_{t} p_{i}=v_{i}
\end{aligned}
$$

The angular motion is governed by the differential equations

$$
\begin{aligned}
\mathrm{d}_{t} \omega_{i} & =I_{i}^{-1} \cdot\left(-\Omega_{i} \cdot I_{i} \cdot \omega_{i}+\tau_{i}\right) \\
\mathrm{d}_{t} R_{i} & =R_{i} \cdot \Omega_{i}
\end{aligned}
$$

where $\Omega$ is a skew-symmetric (3,3)-matrix composed of the three entries of $\omega$ as

$$
\Omega=\left(\begin{array}{ccc}
0 & -\omega_{3} & \omega_{2} \\
\omega_{3} & 0 & -\omega_{1} \\
-\omega_{2} & \omega_{1} & 0
\end{array}\right)
$$

Example: In the illustrations, the ellipsoids visualize the inertia tensor $I_{i}$. The extensions of the shape correspond to the three eigenvalues of $I_{i}$. The center of mass $p_{i}$ is located in the center of the ellipsoid.

## - Constraints by hinges

The location and alignment of the hinge $j=1,2, \ldots, n$ is constant with respect to the two bodies $E(j, 1)$, and $E(j, 2)$, the hinge connects. We define

$$
\begin{array}{ll}
\hat{l}_{j, 1} & \text { location of hinge } j \text { in object coordinates of body } E(j, 1) \bullet \text { constant (3)-vector } \\
\hat{l}_{j, 2} & \text { location of hinge } j \text { in object coordinates of body } E(j, 2) \bullet \text { constant (3)-vector }
\end{array}
$$

and
$\hat{z}_{j, 1} \quad$ axis of hinge $j$ in object coordinates of body $E(j, 1) \bullet$ constant (3)-vector of norm 1
$\hat{z}_{j, 2} \quad$ axis of hinge $j$ in object coordinates of body $E(j, 2) \bullet$ constant (3)-vector of norm 1
For the purpose of enumeration, we define additional vectors $l_{j, i}$ for $i=1,2, \ldots, n+1$ via

$$
l_{j, i}=\left\{\begin{array}{ll}
\hat{l}_{j, 1} & \text { for } i=E(j, 1) \\
\hat{l}_{j, 2} & \text { for } i=E(j, 2) \\
0 & \text { otherwise }
\end{array} \quad z_{j, i}=\left\{\begin{array}{cl}
\hat{z}_{j, 1} & \text { for } i=E(j, 1) \\
\hat{z}_{j, 2} & \text { for } i=E(j, 2) \\
0 & \text { otherwise }
\end{array}\right.\right.
$$

Example: For joint $j=2$ of the skeleton depicted above, we have $l_{2,1}=0$, but $l_{2,2}=\hat{l}_{2,1}$, and $l_{2,3}=\hat{l}_{2,2}$. Analogous, $z_{2,1}=0$, but $z_{2,2}=\hat{z}_{2,1}$, and $z_{2,3}=\hat{z}_{2,2}$.

Henceforth, we use the shorthand $\mathrm{j} 1=E(j, 1)$ and $\mathrm{j} 2=E(j, 2)$. For instance, $p_{\mathrm{j} 1}=p_{E(j, 1)}$ and $z_{j, \mathrm{j} 2}=z_{j, E(j, 2)}$. The hinges shall not separate over the course of the simulation. At any time $t$, we demand

$$
\begin{array}{lc}
p_{\mathrm{j} 1}+R_{\mathrm{j} 1} \cdot l_{j, \mathrm{j} 1}=p_{\mathrm{j} 2}+R_{\mathrm{j} 2} \cdot l_{j, \mathrm{j} 2} & \text { for } j=1,2, \ldots, n \\
R_{\mathrm{j} 1} \cdot z_{\mathrm{j}, \mathrm{j} 1}=R_{\mathrm{j} 2} \cdot z_{j, \mathrm{j} 2} & \tag{1}
\end{array}
$$

The time derivatives $\mathrm{d}_{t}$ of these equations are

$$
\begin{array}{lc}
v_{\mathrm{j} 1}+R_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot l_{j, \mathrm{j} 1}=v_{\mathrm{j} 2}+R_{\mathrm{j} 2} \cdot \Omega_{\mathrm{j} 2} \cdot l_{j, \mathrm{j} 2} & \text { for } j=1,2, \ldots, n  \tag{2}\\
R_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot z_{\mathrm{j}, \mathrm{j} 1}=R_{\mathrm{j} 2} \cdot \Omega_{\mathrm{j} 2} \cdot z_{\mathrm{j}, \mathrm{j} 2} &
\end{array}
$$

Finally, another application of $\mathrm{d}_{t}$ yields the relations

$$
\begin{align*}
& a_{\mathrm{j} 1}+R_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot l_{j, \mathrm{j} 1}-R_{\mathrm{j} 1} \cdot L_{j, \mathrm{j} 1} \cdot \mathrm{~d}_{t} \omega_{\mathrm{j} 1}=a_{\mathrm{j} 2}+R_{\mathrm{j} 2} \cdot \Omega_{\mathrm{j} 2} \cdot \Omega_{\mathrm{j} 2} \cdot l_{j, \mathrm{j} 2}-R_{\mathrm{j} 2} \cdot L_{j, \mathrm{j} 2} \cdot \mathrm{~d}_{t} \omega_{\mathrm{j} 2} \quad \text { for } j=1,2, \ldots, n  \tag{3}\\
& R_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot z_{j, \mathrm{j} 1}-R_{\mathrm{j} 1} \cdot Z_{j, \mathrm{j} 1} \cdot \mathrm{~d}_{t} \omega_{\mathrm{j} 1}=R_{\mathrm{j} 2} \cdot \Omega_{\mathrm{j} 2} \cdot \Omega_{\mathrm{j} 2} \cdot z_{j, \mathrm{j} 2}-R_{\mathrm{j} 2} \cdot Z_{j, \mathrm{j} 2} \cdot \mathrm{~d}_{t} \omega_{\mathrm{j} 2}
\end{align*}
$$

where we have substituted the cross product by vector $l_{j, i}, z_{j, i}$ with the skew-symmetric $(3,3)$-matrix $L_{j, i}, Z_{j, i}$ composed as

$$
L_{j, i}=\left(\begin{array}{ccc}
0 & -l_{j, i_{3}} & l_{j, i_{2}} \\
l_{j, i_{3}} & 0 & -l_{j, i_{1}} \\
-l_{j, i_{2}} & l_{j, i_{1}} & 0
\end{array}\right) \quad \text { and } \quad Z_{j, i}=\left(\begin{array}{ccc}
0 & -z_{j, i_{3}} & z_{j, i_{2}} \\
z_{j, i_{3}} & 0 & -z_{j, i_{1}} \\
-z_{j, i_{2}} & z_{j, i_{1}} & 0
\end{array}\right)
$$

The relations (1), and (2) are meaningful constraints on the initial configuration of the skeleton: the animation launches with the hinges touching and well aligned, and not about to be torn apart. From (3), we derive linear accelerations and torques on the $n+1$ bodies that ensure (1) and (2) over the course of the animation.

## - Dynamic impact at hinges

To model friction and motor control at joint $j$, we introduce

$$
e_{j} \quad \text { intrinsic torque at joint } j \text { in world coordinates } \bullet(3) \text {-vector }
$$

If joint $j$ revolves frictionless and passively, we set $e_{j}=0$. In general, we propose the expression

$$
e_{j}=-\mu_{j}\left[R_{\mathrm{j} 1} \cdot \omega_{\mathrm{j} 1}-R_{\mathrm{j} 2} \cdot \omega_{\mathrm{j} 2}\right]+\beta_{j} R_{\mathrm{j} 1} \cdot z_{j, \mathrm{j} 1}
$$

where $\mu_{j} \geq 0$ is the friction coefficient, and $\beta_{j}$ is the torque of the motor attached to hinge $j$.
In each timestep, we compute (3)-vectors $c_{j}, d_{j}$ in world coordinates for all hinges $j=1,2, \ldots, n$. The vectors $c_{j}, d_{j}$ shall contribute to the linear accelerations and torques of the two bodies $\mathrm{j} 1=E(j, 1)$, and $\mathrm{j} 2=E(j, 2)$, that share the joint $j$. To preserve the total linear and angular momentum, the contribution is with alternating signs as

$$
\begin{array}{ll}
a_{\mathrm{j} 1}+=m_{\mathrm{j} 1}^{-1} c_{j} & \text { for } j=1,2, \ldots, n \\
a_{\mathrm{j} 2}==m_{\mathrm{j} 2}{ }^{-1} c_{j} &
\end{array}
$$

and

$$
\begin{array}{ll}
\tau_{\mathrm{j} 1}+=L_{j, \mathrm{j} 1} \cdot R_{\mathrm{j} 1}{ }^{-1} \cdot c_{j}+Z_{j, \mathrm{j} 1} \cdot R_{\mathrm{j} 1}{ }^{-1} \cdot d_{j}+R_{\mathrm{j} 1}{ }^{-1} \cdot e_{j} \\
\tau_{\mathrm{j} 2}=L_{j, \mathrm{j} 2} \cdot R_{\mathrm{j} 2}{ }^{-1} \cdot c_{j}+Z_{j, \mathrm{j} 2} \cdot R_{\mathrm{j} 2}{ }^{-1} \cdot d_{j}+R_{\mathrm{j} 2}{ }^{-1} \cdot e_{j} & \text { for } j=1,2, \ldots, n \\
\end{array}
$$

In total, the body $i$ is subject to a linear acceleration $a_{i}$ and torque $\tau_{i}$ of

$$
\begin{array}{ll}
a_{i}=m_{i}^{-1} \sum_{j=1}^{n} \sigma_{j, i} c_{j} & \text { for } i=1,2, \ldots, n+1  \tag{4}\\
\tau_{i}=\sum_{j=1}^{n} \sigma_{j, i}\left(L_{j, i} \cdot R_{i}^{-1} \cdot c_{j}+Z_{j, i} \cdot R_{i}^{-1} \cdot d_{j}+R_{i}^{-1} \cdot e_{j}\right) &
\end{array}
$$

Example: The linear accelerations and torques of the four bodies in the skeleton above are of the form

$$
\begin{array}{ll}
a_{1}=m_{1}^{-1}\left(+c_{1}\right) & \tau_{1}=+L_{1,1} \cdot R_{1}{ }^{-1} \cdot c_{1}+Z_{1,1} \cdot R_{1}{ }^{-1} \cdot d_{1}+R_{1}^{-1} \cdot e_{1} \\
a_{2}=m_{2}^{-1}\left(-c_{1}+c_{2}\right) & \tau_{2}=-L_{1,2} \cdot R_{2}^{-1} \cdot c_{1}-Z_{1,2} \cdot R_{2}^{-1} \cdot d_{1}-R_{2}^{-1} \cdot e_{1}+L_{2,2} \cdot R_{2}^{-1} \cdot c_{2}+Z_{2,2} \cdot R_{2}^{-1} \cdot d_{2}+R_{2}^{-1} \cdot e_{2} \\
a_{3}=m_{3}^{-1}\left(-c_{2}\right) & \tau_{3}=-L_{2,3} \cdot R_{3}^{-1} \cdot c_{2}-Z_{2,3} \cdot R_{3}^{-1} \cdot d_{2}-R_{3}{ }^{-1} \cdot e_{2}
\end{array}
$$

Theorem: The linear acceleration $a_{i}$ and torque $\tau_{i}$ for $i=1,2, \ldots, n+1$ as assigned in equations (4) result in the conservation of the total linear momentum, and total angular momentum of the skeleton. If all joints revolve frictionless and passively, i.e. $e_{j}=0$ for all $j=1,2, \ldots, n$, the total kinetic energy is invariant, too.

Proof. The assignments (4) annihilate the time derivative $\mathrm{d}_{t}$ of the total linear momentum

$$
\Sigma_{i=1}^{n+1} m_{i} a_{i}=\Sigma_{i=1}^{n+1} m_{i} m_{i}^{-1} \Sigma_{j=1}^{n} \sigma_{j, i} c_{j}=\sum_{j=1}^{n} \Sigma_{i=1}^{n+1} \sigma_{j, i} c_{j}=\sum_{j=1}^{n} c_{j}-\Sigma_{j=1}^{n} c_{j}=0
$$

and also the derivative $\mathrm{d}_{t}$ of the total angular momentum

$$
\begin{aligned}
& \sum_{i=1}^{n+1} p_{i} \times\left(m_{i} a_{i}\right)+R_{i} \cdot \Omega_{i} \cdot I_{i} \cdot \omega_{i}+R_{i} \cdot I_{i} \cdot \mathrm{~d}_{t} \omega_{i} \\
& =\sum_{i=1}^{n+1} p_{i} \times\left(m_{i} a_{i}\right)+R_{i} \cdot \Omega_{i} \cdot I_{i} \cdot \omega_{i}+R_{i} \cdot I_{i} \cdot\left[I_{i}^{-1} \cdot\left(-\Omega_{i} \cdot I_{i} \cdot \omega_{i}+\tau_{i}\right)\right] \\
& =\sum_{i=1}^{n+1} p_{i} \times\left(m_{i} a_{i}\right)+R_{i} \cdot \tau_{i} \\
& =\sum_{j=1}^{n} p_{\mathrm{j} 1} \times c_{j}+R_{\mathrm{j} 1} \cdot\left[l_{j, \mathrm{j} 1} \times\left(R_{\mathrm{j} 1}{ }^{-1} \cdot c_{j}\right)+z_{j, \mathrm{j} 1} \times\left(R_{\mathrm{j} 1}{ }^{-1} \cdot d_{j}\right)+R_{\mathrm{j} 1}{ }^{-1} \cdot e_{j}\right]- \\
& \quad p_{\mathrm{j} 2} \times c_{j}-R_{\mathrm{j} 2} \cdot\left[l_{j, \mathrm{j} 2} \times\left(R_{\mathrm{j} 2}{ }^{-1} \cdot c_{j}\right)+z_{j, \mathrm{j} 2} \times\left(R_{\mathrm{j} 2}^{-1} \cdot d_{j}\right)+R_{\mathrm{j} 2}{ }^{-1} \cdot e_{j}\right] \\
& =\sum_{j=1}^{n} p_{\mathrm{j} 1} \times c_{j}+\left(R_{\mathrm{j} 1} \cdot l_{j, \mathrm{j} 1}\right) \times c_{j}-p_{\mathrm{j} 2} \times c_{j}-\left(R_{\mathrm{j} 2} \cdot l_{j, \mathrm{j} 2}\right) \times c_{j}+\left(R_{\mathrm{j} 1} \cdot z_{j, \mathrm{j} 1}-R_{\mathrm{j} 2} \cdot z_{j, \mathrm{j} 2}\right) \times d_{j}+e_{j}-e_{j} \\
& =\sum_{j=1}^{n}\left(p_{\mathrm{j} 1}+R_{\mathrm{j} 1} \cdot l_{j, \mathrm{j} 1}-p_{\mathrm{j} 2}-R_{\mathrm{j} 2} \cdot l_{j, \mathrm{j} 2}\right) \times c_{j}+0 \times d_{j}+0 \\
& =\sum_{j=1}^{n} 0 \times c_{j} \\
& =0
\end{aligned}
$$

making use of the relation $Q .\left[a \times\left(Q^{-1} . b\right)\right]=(Q . a) \times b$ for any (3)-vectors $a, b$ and orthogonal (3,3)-matrix $Q$. The derivative $\mathrm{d}_{t}$ of the total kinetic energy simplifies to

$$
\begin{aligned}
& \Sigma_{i=1}^{n+1} m_{i} v_{i} \cdot a_{i}+\omega_{i} \cdot I_{i} \cdot \mathrm{~d}_{t} \omega_{i} \\
& =\sum_{i=1}^{n+1} \sum_{j=1}^{n} m_{i} m_{i}^{-1} \sigma_{j, i} v_{i} \cdot c_{j}+\omega_{i} \cdot I_{i} \cdot I_{i}^{-1} \cdot\left(-\Omega_{i} \cdot I_{i} \cdot \omega_{i}+\sigma_{j, i} L_{j, i} \cdot R_{i}^{-1} \cdot c_{j}+\sigma_{j, i} Z_{j, i} \cdot R_{i}^{-1} \cdot d_{j}+\sigma_{j, i} R_{i}^{-1} \cdot e_{j}\right) \\
& =\sum_{i=1}^{n+1} \sum_{j=1}^{n} \sigma_{j, i} v_{i} \cdot c_{j}-\omega_{i} \cdot \Omega_{i} \cdot I_{i} \cdot \omega_{i}+\sigma_{j, i} \omega_{i} \cdot L_{j, i} \cdot R_{i}^{-1} \cdot c_{j}+\sigma_{j, i} \omega_{i} \cdot Z_{j, i} \cdot R_{i}^{-1} \cdot d_{j}+\sigma_{j, i} \omega_{i} \cdot R_{i}^{-1} \cdot e_{j} \\
& =\sum_{j=1}^{n} \sum_{i=1}^{n+1} \sigma_{j, i}\left[v_{i}+\omega_{i} \cdot L_{j, i} \cdot R_{i}^{-1}\right] \cdot c_{j}+\sigma_{j, i} d_{j} \cdot R_{i} \cdot \Omega_{i} \cdot z_{j, i}+\sigma_{j, i} e_{j} \cdot R_{i} \cdot \omega_{i} \\
& =\sum_{j=1}^{n}\left[v_{\mathrm{j} 1}+R_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot l_{j, \mathrm{j} 1}-v_{\mathrm{j} 2}-R_{\mathrm{j} 2} \cdot \Omega_{\mathrm{j} 2} \cdot l_{j, \mathrm{j} 2}\right] \cdot c_{j}+d_{j} \cdot\left[R_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot z_{j, \mathrm{j} 1}-R_{\mathrm{j} 2} \cdot \Omega_{\mathrm{j} 2} \cdot z_{j, \mathrm{j} 2}\right]+e_{j} \cdot\left[R_{\mathrm{j} 1} \cdot \omega_{\mathrm{j} 1}-R_{\mathrm{j} 2} \cdot \omega_{\mathrm{j} 2}\right] \\
& =\sum_{j=1}^{n} 0 \cdot c_{j}+d_{j} \cdot 0+e_{j} \cdot\left[R_{\mathrm{j} 1} \cdot \omega_{\mathrm{j} 1}-R_{\mathrm{j} 2} \cdot \omega_{\mathrm{j} 2}\right] \\
& =\sum_{j=1}^{n} e_{j} \cdot\left[R_{\mathrm{j} 1} \cdot \omega_{\mathrm{j} 1}-R_{\mathrm{j} 2} \cdot \omega_{\mathrm{j} 2}\right]
\end{aligned}
$$

because $\quad \omega_{i} \cdot \Omega_{i}=\omega_{i} \times \omega_{i}=0, \quad \omega_{i} \cdot L_{j, i} \cdot R_{i}^{-1}=-R_{i} \cdot L_{j, i} \cdot \omega_{i}=R_{i} \cdot \Omega_{i} \cdot l_{j, i}, \quad$ analogous, $\quad \omega_{i} \cdot Z_{j, i} \cdot R_{i}^{-1}=R_{i} \cdot \Omega_{i} \cdot z_{j, i}$, $\sum_{i=1}^{n+1} \sigma_{j, i}=\sigma_{j, \mathrm{j} 1}+\sigma_{j, \mathrm{j} 2}$, and equations (2). If $e_{j}=0$ for all $j=1,2, \ldots, n$, the total kinetic energy is invariant.

Remark: Each conservation law is granted by a different argument:
total linear momentum : topology $\quad \sigma_{j, \mathrm{j} 1}+\sigma_{j, \mathrm{j} 2}=0$
total angular momentum : position of joint equations (1)
total kinetic energy : velocity of joint equations (2)
At this point, the remaining issue is the computation of the vectors $c_{j}, d_{j}$ for $j=1,2, \ldots, n$. To solve for these $6 n$ unknowns, we substitute the terms (4) into equations (3). The vectors $c_{j}, d_{j}$ are determined by a linear system of equations.

We convert the terms (4) into the notation of equations (3): From $a_{i}=m_{i}^{-1} \sum_{j=1}^{n} \sigma_{j, i} c_{j}$, we yield

$$
\begin{array}{ll}
a_{\mathrm{j} 1}=m_{\mathrm{j} 1}^{-1} \sum_{k=1}^{n} \sigma_{k, \mathrm{j} 1} c_{k} & \text { for } j=1,2, \ldots, n \\
a_{\mathrm{j} 2}=m_{\mathrm{j} 2}^{-1} \sum_{k=1}^{n} \sigma_{k, \mathrm{j} 2} c_{k} &
\end{array}
$$

Further, we substitute $\tau_{i}=\sum_{j=1}^{n} \sigma_{j, i}\left[L_{j, i} \cdot R_{i}{ }^{-1} \cdot c_{j}+Z_{j, i} \cdot R_{i}{ }^{-1} \cdot d_{j}+R_{i}{ }^{-1} \cdot e_{j}\right]$ into the differential equation $\mathrm{d}_{t} \omega_{i}=I_{i}^{-1} .\left(-\Omega_{i} \cdot I_{i} \cdot \omega_{i}+\tau_{i}\right)$ and yield

$$
\begin{aligned}
& \mathrm{d}_{t} \omega_{\mathrm{j} 1}=I_{\mathrm{j} 1}{ }^{-1} \cdot\left(-\Omega_{\mathrm{j} 1} \cdot I_{\mathrm{j} 1} \cdot \omega_{\mathrm{j} 1}+\sum_{k=1}^{n} \sigma_{k, \mathrm{j} 1}\left[L_{k, \mathrm{j} 1} \cdot R_{\mathrm{j} 1}{ }^{-1} \cdot c_{k}+Z_{k, \mathrm{j} 1} \cdot R_{\mathrm{j} 1}{ }^{-1} \cdot d_{k}+R_{\mathrm{j} 1}{ }^{-1} \cdot e_{k}\right]\right) \quad \text { for } j=1,2, \ldots, n \\
& \mathrm{~d}_{t} \omega_{\mathrm{j} 2}=I_{\mathrm{j} 2}{ }^{-1} \cdot\left(-\Omega_{\mathrm{j} 2} \cdot I_{\mathrm{j} 2} \cdot \omega_{\mathrm{j} 2}+\sum_{k=1}^{n} \sigma_{k, \mathrm{j} 2}\left[L_{k, \mathrm{j} 2} \cdot R_{\mathrm{j} 2}{ }^{-1} \cdot c_{k}+Z_{k, \mathrm{j} 2} \cdot R_{\mathrm{j} 2}{ }^{-1} \cdot d_{k}+R_{\mathrm{j} 2}{ }^{-1} \cdot e_{k}\right]\right)
\end{aligned}
$$

The substitution of $a_{\mathrm{j} 1}$, and $\mathrm{d}_{t} \omega_{\mathrm{j} 1}$ into the lhs of the equations (3) results in

$$
\begin{aligned}
& \left(m_{\mathrm{j} 1}{ }^{-1} \Sigma_{k} \sigma_{k, \mathrm{j} 1} c_{k}\right)+R_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot l_{j \mathrm{j} 1}-R_{\mathrm{j} 1} \cdot L_{j, \mathrm{j} 1} \cdot I_{\mathrm{j} 1}{ }^{-1} \cdot\left(-\Omega_{\mathrm{j} 1} \cdot I_{\mathrm{j} 1} \cdot \omega_{\mathrm{j} 1}+\Sigma_{k} \sigma_{k, \mathrm{j} 1}\left[L_{k, \mathrm{j} 1} \cdot R_{\mathrm{j} 1}{ }^{-1} \cdot c_{k}+Z_{k, \mathrm{j} 1} \cdot R_{\mathrm{j} 1}{ }^{-1} \cdot d_{k}+R_{\mathrm{j} 1}{ }^{-1} \cdot e_{k}\right]\right) \\
& =\left(m_{\mathrm{j} 1}^{-1} \Sigma_{k} \sigma_{k, \mathrm{j} 1} c_{k}\right)+R_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot l_{\mathrm{j}, \mathrm{j} 1}+R_{\mathrm{j} 1} \cdot L_{\mathrm{j}, \mathrm{j} 1} \cdot I_{\mathrm{j} 1}{ }^{-1} \cdot \Omega_{\mathrm{j} 1} \cdot I_{\mathrm{j} 1} \cdot \omega_{\mathrm{j} 1}- \\
& \quad R_{\mathrm{j} 1} \cdot L_{j, \mathrm{j} 1} \cdot I_{\mathrm{j} 1}{ }^{-1} \cdot \Sigma_{k} \sigma_{k, \mathrm{j} 1}\left[L_{k, \mathrm{j} 1} \cdot R_{\mathrm{j} 1}{ }^{-1} \cdot c_{k}+Z_{k, \mathrm{j} 1} \cdot R_{\mathrm{j} 1}{ }^{-1} \cdot d_{k}+R_{\mathrm{j} 1}{ }^{-1} \cdot e_{k}\right] \\
& = \\

& \quad R_{\mathrm{j} 2} \cdot \Omega_{\mathrm{j} 2} \cdot \Omega_{\mathrm{j} 2} \cdot l_{j, \mathrm{j} 2}+R_{\mathrm{j} 2} \cdot L_{j, \mathrm{j} 2} \cdot I_{\mathrm{j} 2}{ }^{-1} \cdot \Omega_{\mathrm{j} 2} \cdot I_{\mathrm{j} 2} \cdot \omega_{\mathrm{j} 2}
\end{aligned}
$$

and secondly

$$
\begin{aligned}
& {\left[\Sigma_{k} \sigma_{k, \mathrm{j} 2}\left(\left[-R_{\mathrm{j} 2} \cdot L_{j, \mathrm{j} 2} \cdot I_{\mathrm{j} 2}{ }^{-1} \cdot L_{k, \mathrm{j} 2} \cdot R_{\mathrm{j} 2}{ }^{-1}\right] \cdot c_{k}-R_{\mathrm{j} 2} \cdot Z_{j, \mathrm{j} 2} \cdot I_{\mathrm{j} 2}{ }^{-1} \cdot Z_{k, \mathrm{j} 2} \cdot R_{\mathrm{j} 2}{ }^{-1} \cdot d_{k}-R_{\mathrm{j} 2} \cdot Z_{j, \mathrm{j} 2} \cdot I_{\mathrm{j} 2}{ }^{-1} \cdot R_{\mathrm{j} 2}{ }^{-1} \cdot e_{k}\right)\right]+} \\
& \quad R_{\mathrm{j} 2} \cdot \Omega_{\mathrm{j} 2} \cdot \Omega_{\mathrm{j} 2} \cdot z_{j, \mathrm{j} 2}+R_{\mathrm{j} 2} \cdot Z_{j, \mathrm{j} 2} \cdot I_{\mathrm{j} 2}{ }^{-1} \cdot \Omega_{\mathrm{j} 2} \cdot I_{\mathrm{j} 2} \cdot \omega_{\mathrm{j} 2}
\end{aligned}
$$

For $j, k=1,2, \ldots, n$, we define (6,6)-matrices

$$
\begin{align*}
& A_{j, k, 1}=\sigma_{k, \mathrm{j} 1}\left(\begin{array}{cc}
R_{\mathrm{j} 1} \cdot L_{j, \mathrm{j} 1} \cdot I_{\mathrm{j} 1}{ }^{-1} \cdot L_{k, \mathrm{j} 1} \cdot R_{\mathrm{j} 1}{ }^{-1}-m_{\mathrm{j} 1}{ }^{-1} \mathbf{1} & R_{\mathrm{j} 1} \cdot L_{j, \mathrm{j} 1} \cdot I_{\mathrm{j} 1}{ }^{-1} \cdot Z_{k, \mathrm{j} 1} \cdot R_{\mathrm{j} 1}{ }^{-1} \\
R_{\mathrm{j} 1} \cdot Z_{j, \mathrm{j} 1} \cdot I_{\mathrm{j} 1}{ }^{-1} \cdot L_{k, \mathrm{j} 1} \cdot R_{\mathrm{j} 1}{ }^{-1} & R_{\mathrm{j} 1} \cdot Z_{j, \mathrm{j} 1} \cdot I_{\mathrm{j} 1}{ }^{-1} \cdot Z_{k, \mathrm{j} 1} \cdot R_{\mathrm{j} 1}{ }^{-1}
\end{array}\right)  \tag{5}\\
& A_{j, k, 2}=\sigma_{k, \mathrm{j} 2}\left(\begin{array}{cc}
R_{\mathrm{j} 2} \cdot L_{j, \mathrm{j} 2} \cdot I_{\mathrm{j} 2}{ }^{-1} \cdot L_{k, \mathrm{j} 2} \cdot R_{\mathrm{j} 2}{ }^{-1}-m_{\mathrm{j} 2}{ }^{-1} \mathbf{1} & R_{\mathrm{j} 2} \cdot L_{j, \mathrm{j} 2} \cdot I_{\mathrm{j} 2}{ }^{-1} \cdot Z_{k, \mathrm{j} 2} \cdot R_{\mathrm{j} 2}{ }^{-1} \\
R_{\mathrm{j} 2} \cdot Z_{j, \mathrm{j} 2} \cdot I_{\mathrm{j} 2}{ }^{-1} \cdot L_{k, \mathrm{j} 2} \cdot R_{\mathrm{j} 2}{ }^{-1} & R_{\mathrm{j} 2} \cdot Z_{j, \mathrm{j} 2} \cdot I_{\mathrm{j} 2}{ }^{-1} \cdot Z_{k, \mathrm{j} 2} \cdot R_{\mathrm{j} 2}{ }^{-1}
\end{array}\right)
\end{align*}
$$

and (6)-vectors

$$
\begin{array}{r}
b_{j, 1}=\binom{R_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot l_{\mathrm{j}, \mathrm{j} 1}+R_{\mathrm{j} 1} \cdot L_{j, \mathrm{j} 1} \cdot I_{\mathrm{j} 1}{ }^{-1} \cdot \Omega_{\mathrm{j} 1} \cdot I_{\mathrm{j} 1} \cdot \omega_{\mathrm{j} 1}-\Sigma_{k} \sigma_{k, \mathrm{j} 1} R_{\mathrm{j} 1} \cdot L_{j, \mathrm{j} 1} \cdot I_{\mathrm{j} 1}{ }^{-1} \cdot R_{\mathrm{j} 1}{ }^{-1} \cdot e_{k}}{R_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot \Omega_{\mathrm{j} 1} \cdot z_{j, \mathrm{j} 1}+R_{\mathrm{j} 1} \cdot Z_{\mathrm{j}, \mathrm{j} 1} \cdot I_{\mathrm{j} 1}{ }^{-1} \cdot \Omega_{\mathrm{j} 1} \cdot I_{\mathrm{j} 1} \cdot \omega_{\mathrm{j} 1}-\Sigma_{k} \sigma_{k, \mathrm{j} 1} R_{\mathrm{j} 1} \cdot Z_{j, \mathrm{j} 1} \cdot \mathrm{I}_{\mathrm{j} 1}^{-1} \cdot R_{\mathrm{j} 1}{ }^{-1} \cdot e_{k}} \\
b_{j, 2}=\binom{R_{\mathrm{j} 2 \cdot} \cdot \Omega_{\mathrm{j} 2} \cdot \Omega_{\mathrm{j} 22} \cdot l_{\mathrm{j}, \mathrm{j} 2}+R_{\mathrm{j} 2} \cdot L_{j, \mathrm{j} 2} \cdot I_{\mathrm{j} 2}{ }^{-1} \cdot \Omega_{\mathrm{j} 22} \cdot I_{\mathrm{j} 2} \cdot \omega_{\mathrm{j} 2}-\Sigma_{k} \sigma_{k, \mathrm{j} 2} R_{\mathrm{j} 2} \cdot L_{j, \mathrm{j} 2} \cdot I_{\mathrm{j} 2}{ }^{-1} \cdot R_{\mathrm{j} 2}{ }^{-1} \cdot e_{k}}{R_{\mathrm{j} 22 \cdot} \cdot \Omega_{\mathrm{j} 2} \cdot \Omega_{\mathrm{j} 2} \cdot z_{j, \mathrm{j} 2}+R_{\mathrm{j} 2} \cdot Z_{j, \mathrm{j} 2} \cdot I_{\mathrm{j} 2}{ }^{-1} \cdot \Omega_{\mathrm{j} 2} \cdot I_{\mathrm{j} 2} \cdot \omega_{\mathrm{j} 2}-\Sigma_{k} \sigma_{k, \mathrm{j} 2} R_{\mathrm{j} 2} \cdot Z_{j, \mathrm{j} 2} \cdot I_{\mathrm{j} 2}{ }^{-1} \cdot R_{\mathrm{j} 2}{ }^{-1} \cdot e_{k}}
\end{array}
$$

Then, equations (3) transform into $-\left[\Sigma_{k} A_{j, k, 1} \cdot\binom{c_{k}}{d_{k}}\right]+b_{j, 1}=-\left[\Sigma_{k} A_{j, k, 2} \cdot\binom{c_{k}}{d_{k}}\right]+b_{j, 2}$, or equivalently

$$
\sum_{k=1}^{n}\left(A_{j, k, 1}-A_{j, k, 2}\right) \cdot\binom{c_{k}}{d_{k}}=b_{j, 1}-b_{j, 2} \quad \text { for } j=1,2, \ldots, n .
$$

## - Introduction of spherical joints

To replace a hinge $j$ by a spherical joint, we set the vector that represents the axis of the joint to zero, i.e. $\hat{z}_{j, 1}=0$ and $\hat{z}_{j, 2}=0$. Consequently, $z_{j, i}=0$ for all $i=1,2, \ldots, n+1$. The equations of (1), (2), (3) that involve $z_{j, i}$ hold trivially.

Example: In the illustration below, joint $j=1$ is a hinge, and joint $j=2$ is a spherical joint. Therefore, we have $\hat{z}_{2,1}=0$ and $\hat{z}_{2,2}=0$.

## - Algorithm for animation

We describe how to 'integrate' the skeleton from time $t$ over a time interval of length $h>0$ to the next frame $t+h$. The input to the algorithm are the entities $p_{i}, R_{i}, v_{i}, \omega_{i}, I_{i}, m_{i}$, and $L_{j, i}, Z_{j, i}, e_{j}$ for all bodies $i=1,2, \ldots, n+1$ and joints $j=1,2, \ldots, n$ at time $t$, and the duration $h$. The values shall comply with the initial conditions (1) and (2). We determine the vectors $c_{j}, d_{j}$ by solving the system of linear equations

$$
\left(\begin{array}{ccc}
A_{1,1,1}-A_{1,1,2} & \cdots & A_{1, n, 1}-A_{1, n, 2}  \tag{6}\\
\vdots & \ddots & \vdots \\
A_{n, 1,1}-A_{n, 1,2} & \cdots & A_{n, n, 1}-A_{n, n, 2}
\end{array}\right) \cdot\left(\begin{array}{c}
c_{1} \\
d_{1} \\
\vdots \\
c_{n} \\
d_{n}
\end{array}\right)=\left(\begin{array}{c}
b_{1,1}-b_{1,2} \\
\vdots \\
b_{n, 1}-b_{n, 2}
\end{array}\right)
$$

The terms $A_{j, k, 1}, A_{j, k, 2}, b_{j, 1}$, and $b_{j, 2}$ are defined in (5). Then, the linear accelerations $a_{i}$, and the torques $\tau_{i}$ are

$$
\begin{aligned}
& a_{i}=m_{i}^{-1} \sum_{j=1}^{n} \sigma_{j, i} c_{j} \\
& \tau_{i}=\sum_{j=1}^{n} \sigma_{j, i}\left(L_{j, i} \cdot R_{i}^{-1} \cdot c_{j}+Z_{j, i} \cdot R_{i}^{-1} \cdot d_{j}+R_{i}^{-1} \cdot e_{j}\right)
\end{aligned}
$$

$$
\text { for } i=1,2, \ldots, n+1
$$

We reassign

$$
\begin{array}{ll}
v_{i}:=v_{i}+a_{i} h & \text { for } i=1,2, \ldots, n+1 \\
p_{i}:=p_{i}+v_{i} h & \\
\omega_{i}:=\omega_{i}+I_{i}^{-1} \cdot\left(-\Omega_{i} \cdot I_{i} \cdot \omega_{i}+\tau_{i}\right) h & \\
R_{i}:=R_{i} \cdot \exp \left[\Omega_{i} h\right] &
\end{array}
$$

The new values $p_{i}, R_{i}, v_{i}, \omega_{i}$ represent the dynamic configuration of the skeleton at time $t+h$ and are the output of the algorithm. (The (3,3)-matrix $\exp \left[\Omega_{i} h\right]=\sum_{k=0}^{\infty}\left(\Omega_{i} h\right)^{k} /(k!)$ is orthogonal.)

Remark: Equation (6) contains $6 n$ unknowns: $c_{j}, d_{j}$ for $j=1,2, \ldots, n$. However, the matrix is only of rank $5 n_{h}+3 n_{s}$, where $n_{h}$ is the number of hinges, $n_{s}$ is the number of spherical joints, and $n_{h}+n_{s}=n$. If joint $j$ is a hinge, the vector $d_{j}$ is constrained to the plane orthogonal to the axis of the hinge $R_{\mathrm{j} 1} \cdot z_{\mathrm{j} 1}=R_{\mathrm{j} 2} \cdot z_{\mathrm{j} 2}$. If joint $j$ is a spherical joint, then $d_{j}=0$.

The solutions $c_{j}, d_{j}$ of (6) are readily obtained via the pseudoinverse. An implementation of the singular value decomposition is stated in the book Numerical Recipes in $C++$, 2nd edition written by Press, Teucholsky, Vetterling, Flannery.

Remark: The substitution of $\sigma_{k, \mathrm{j} 1}=\delta_{E(j, 1), E(k, 1)}-\delta_{E(j, 1), E(k, 2)}$, and $\sigma_{k, \mathrm{j} 2}=\delta_{E(j, 2), E(k, 1)}-\delta_{E(j, 2), E(k, 2)}$ with

$$
\delta_{i_{1}, i_{2}}= \begin{cases}1 & \text { if } i_{1}=i_{2} \\ 0 & \text { otherwise }\end{cases}
$$

transforms an entry of the block matrix of (6) into the alternate form

$$
\begin{aligned}
& A_{j, k, 1}-A_{j, k, 2}= \\
& +\delta_{E(j, 1), E(k, 1)}\left(\begin{array}{cl}
